

Physiology week 10- Cardiovascular (special) VIVAs

<p>Question 1:</p> <p>Cerebral blood flow & its regulation.</p> <p>Ganong pp 611-620</p>	<p>i) What factors determine cerebral blood flow?</p> <p><u>Prompt:</u> What about pressure or vascular factors?</p> <p>ii) Additional: Describe the process of autoregulation.</p>	<p>(1) Pressures:</p> <ul style="list-style-type: none"> - MAP - Intracranial pressure / extra-cranial venous pressure (whichever is greatest). <i>Intracranial pressure is determined by intracranial blood volume, CSF volume, tissue oedema, SOL.</i> <p>(2) Cerebral arteriole tone</p> <ul style="list-style-type: none"> - Autoregulation Maintains normal CBF at MAPs of 65-140 mmHg (stretch response[myogenic], local [metabolic]); <i>Autoregulation may be lost/impaired by brain injury</i> - pCO2 (effect on both arteriole tone and intracranial blood volume) - pO2 (at extremes) <p>(3) Blood viscosity</p>
<p>3.3 Cerebral blood flow. Brain metabolism & O2 requirements Ganong pp 616-620</p>	<p>What factors determine cerebral blood flow?</p> <p>What substances are important for brain metabolism?</p>	<p>(4 of 5)</p> <ul style="list-style-type: none"> • Intracranial pressure • Local constriction/dilation of cerebral arterioles, autoregulation etc • MAP at brain level • Blood viscosity • Mean venous press at brain level <ul style="list-style-type: none"> • Oxygen ~49ml/min = 20% body O2 consumption • Glucose (major energy source) ~77mg/min • Glutamate (converted to glutamine as detox mech NH3) ~5.6mg/min
<p>1.1 Factors affecting cerebral blood flow</p>	<p>Describe the factors involved in regulating cerebral blood flow</p> <p>Describe how blood flow can vary in different parts of the brain</p>	<p>Arterial P, viscosity, Venous P, local control of arterioles, CSF, ICP. Monroe Kellie doctrine. Cushing reflex. Local autoregulation</p> <p>Active neurons attract blood flow and oxygen in excess of needs; marked variation bl flow with activity. PET and fMRI imaging</p>
<p>2 a). What chemical factors regulate coronary blood flow</p>	<p>Increases in blood flow occur secondary to coronary vasodilation due to:</p> <ul style="list-style-type: none"> • Hypoxia, • Locally increased CO2, • H⁺, • K⁺, • lactate, • PGs, • adenine nucleotides, • adenosine 	<p>Hypoxia plus 3 others</p>
<p>2 b). Describe the neural regulation of coronary blood flow</p>	<p>Alpha-adrenergic receptors mediate vasoconstriction Beta-adrenergic receptors mediate vasodilation</p> <p>Vagal nerve stimulation dilates coronaries. Noradrenaline constricts coronaries (although noradrenergic nerves cause increased HR and contractility, with resultant metabolite prod and vasodilation- this is the effect with hypotension that maintains coronary flow)</p>	<p>Alpha-adrenergic – Vc, and beta-adrenergic – Vd effects.</p>

TOPIC: Regulation of coronary blood flow NUMBER: 1

OPENING QUESTION	What are the factors which affect coronary blood flow?	PROMPTS	COMMENTS
POINTS REQUIRED	<p>Aortic pressure changes, chemical and neural factors</p> <p>Autoregulation</p> <p><u>Chemical</u>- low O₂, increased CO₂, H⁺, K⁺, Lactate, prostaglandins, adenine nucleosides, adenosine</p> <p><u>Neural</u>- NAD-pos inotropic and chronotropic effects → vasodilator metabolites → cor vasodilation</p> <p>B-Blocker for inotropic and chronotropic effects → then Nad → cor vasoconstriction via receptors</p> <p>B receptors and vagus → vasodilation</p> <p>Low Blood press → metabolic changes in myocardium → cor art vasodilation.</p> <p><u>Phase of cardiac cycle</u>: more flow in diastole esp left cor art > right, heart rate</p> <p>Disease states that reduce flow: cor art disease, valve lesions -AS, raised venous press - CHF</p> <p>Chemical vasodilators: O₂ lack, CO₂, H⁺, K⁺, lactate, PGs, adenine etc, adenosine</p> <p>*Neural: AdrenoRs - alpha-constrict, beta-dilate, vagal - dilate</p>	Is there any difference in coronary blood flow to the right and left ventricles?	Need 3 factors and 1 example of each.

1. (a) Describe how tissues regulate their own blood flow.	<p>Most vascular beds have intrinsic capacity to compensate for moderate changes in perfusion pressure by changing vascular resistance and therefore maintaining constant bld flow.</p> <p>1. Myogenic theory of autoregulation:</p> <p>Intrinsic contractile response of smooth muscle to stretch</p> <p>As pressure rises: blood vessels are distended → vascular smooth muscle surrounding vessels contract</p> <p>Law of Laplace: maintenance of given wall tension, as pressure rises, requires a decrease in radius</p> <p>2. Metabolic theory of autoregulation</p> <p>Vasodilator substances tend to accumulate in active tissues when blood flow decreases → dilatation</p> <p>When blood flow increases → washed away</p> <p>Hypox, inc CO₂, inc H⁺, inc lactate, inc K⁺, inc temp, histamine, adenosine</p>	<p>1. Myogenic theory of autoregulation</p> <p>2. Metabolic theory of autoregulation</p> <p>To pass must demonstrate understanding of both</p>
